: Concerning the Organization of Measures to Title

Control Coeunurosis and Echinococcys.

Orig Pub: Veterinarya, 1956, No 11, 24-28

Abstract: Among the methods for the fight against coeun-

urosis and echinococcus the authors recommend deworming of dogs twice a year, destruction of invasive material and a complete and timely removal from the flock of the affected sheep and goats and their concentration in special groups. The authors give great importance to this method and

cite arguments in favor of its expediency.

Slides on the Tyub-Karagan Peninsula (Opolzni

poluostrova Tyub-Karagan)

PERIODICAL:

Vestn. Leningr. un-ta, 1956, Nr 24, pp 127-141

ABSTRACT:

Land slides occur in a continuous belt along the northern shore and the northern part of the western shore of the Tyub-Karagan peninsula. These slides are classified as the Tyub-Karagan type. Two kinds of slides can be distinguished: 1) Slides which dislodge bedrock forming escarpments. In the upper part of the slope there lies a pervious, compact, rigid and fissured layer of Neogene limestones (40 m to 50 m thick), which rests on an impervious layer of clay.

Some of the slides take place along the contact plane

Card 1/3

14-57-7-14507

Slides on the Tyub-Karagan Peninsula (Cont.)

between the clay and limestone, but normally, slabs broken off the limestone disclose a vertical displacement. This can be explained either by the presence of water on the contact plane or by the limestone slabs settling along the surface of the vertical fissures intersecting both the limestone and the clay. 2) Slides which dislodge marine terraces. These are produced when the sea undercuts the terraces and when ancient slides at the base of the terraces rest on clays of the Maykop series. Large volumes which participate in these slides are bounded by the vertical fissures and assume the forms of long bands extending along the shore of extremely irregular bodies. The abrading action of the sea and ground waters is the chief cause of slides of the Tyub-Karagan type. Climatic changes influence fluctuations in sea level and in the amount of ground water. The author discusses the history of slide formations in the light of fluctuations in the level of the Caspian Sea. Because present precipitation and amount of ground water are very small, and because the level of the Caspian Sea is low, contemporary Card 2/3

14-57-7-14507

Slides on the Tyub-Karagan Peninsula (Cont.)

slides are far less extensive than the former ones. A bibliography of 12 titles is included. Card 3/3

Class 74, No. 184661 /announced by All-Union Scientific Research Institute of Mining Geomechanics and Surveying (Vsesoyuznyy nauchno-issledovatel'skiy institut gornoy geomekhaniki i marksheyderskogo dela)7 SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 156 TOPIC TAGS: digital analog converter, analog digital encoder ABSTRACT: An Author Certificate has been issued for an angular-value-to-digital-code converter. A coding disk, which is rigidly attached to its input shaft, has a kinematic circuit and two computing systems. Each system consists of an illuminator, a slotted diaphragm, and a photoreceiver. One of these systems is mobile, thus [SA] simplifying the design and reducing the size of the converter. SUBM DATE: 29Apr65 SUB CODE: 09/ 'UDC: 654.94:681. 142.07.07 1/1 nst Card

"Density of the Snow of Show Drifts (Snezlmiki)", Dokl. AN Uz SSR, No 1, 37-42, 1954.

As the result of a study of the density of the snow in snow drifts (in their upper layers down to 40 cm), which was carried out by an expedition of the Division of Hydrology of the Institute of Constructions, Academy of Sciences of Uzbek SSR, in various mountainous regions of Central Asia, USSR hydrologists have observed a regular increase in the density of snow with time and its decrease with elevation into the mountains (with increasing Height). This law holds for comparatively large ranges of altitudes and for mean values of snow densities. (RZhGeol, No 5, 1954). SO: Sum No. 443, 5 Apr. 55
